CLASSIC APPLICATIONS - Car and Light Commercial (Pre-1990)

Classic Manufacturer Index	175	Classic Applications	178 - 234
Spark Plug Selection for Classic Engines	176 - 177		

This catalogue is intended for vehicles/engines officially imported or manufactured in the UK and supersedes all previous versions, which should be disposed of. Whilst every care is taken in compiling these lists of applications, they are given for general guidance only, and do not constitute any contractual term, representation, or warranty and as such Niterra UK Ltd. do not accept any responsibility in respect of any claim whatsoever and howsoever caused arising from the publication of this catalogue.

NGK and NTK products **distributed by Niterra UK Ltd** are designed solely for use in automotive, motorcycle, marine, horticultural, agricultural, commercial, industrial, and stationary engines. **They should not be used in aircraft engines.** Niterra goods destined for aviation use are likely to differ in specification and should be purchased through the OES parts supplier for the engine.

Resistor spark plugs should always be used where they are recommended by the manufacturer. The use of non-resistor plugs could, in some cases, result in interference with and/or damage to electronic components.

Specifications subject to change without notice.

NGK and NTK products listed in these application guides do not apply to racing or modified engines, except where explicitly stated.

SPARK PLUG DESIGN

SPARK PLUG DESIGN

Every year the range of NGK spark plugs grows to accommodate the ever increasing demands of modern engines. Spark plug design must take into consideration many features of an engine including physical dimensions, combustion chamber shape, cooling abilities, fuel and ignition systems. Spark plugs play a vital role in producing the maximum power from an engine whilst keeping fuel consumption and emissions to a minimum. Choosing the correct spark plug type will help a vehicle manufacturer meet legislated emission targets and assists the motorist in getting the best from their engine.

Increases in the size and the requirement to improve the cooling of the inlet and exhaust valves have meant that the space available for the spark plug is severely restricted on some cylinder heads. A change in spark plug design, possibly the adoption of a taper seat and extended reach (threaded portion) or even the use of a smaller diameter is often the answer. Some engines require the use of two spark plugs per cylinder and again due to space restrictions these might be of different sizes.

Changes in fuelling systems and the fuel itself have meant some special features being adopted at the 'firing end' of the spark plug. Extra projected types push the spark position into the heart of the combustion chamber to promote better combustion of the fuel/air mixture, which is weaker than ever in an effort to improve economy. Modern engine manufacturers often require increased spark gaps to allow a longer spark duration, which again aids more efficient combustion.

To combat the 'cold fouling' effect that can occur in some engines using unleaded fuels specially arranged ground electrodes are sometimes used. These can force the spark to discharge across the insulator and thus burn away any built up carbon that could cause poor starting or misfires. It is not uncommon to find two, three or four ground electrode arrangements in new vehicles. The use of precious metals on the tips of the spark plug electrodes is not uncommon especially on higher performance engines. Whilst these spark plugs do have increased service life they are often specified because of their superior ignition qualities.

Our engineering departments work very closely with the engine and vehicle manufacturers to produce the ideal spark plug type for each application. Any change in production is expensive for a manufacturer and therefore new spark plug types are only produced where necessary. Niterra employ the very latest production technology to ensure that every aspect is catered for – performance, economy and value.

HEAT RANGE AND HEAT DISSIPATION

Spark plugs do not produce heat in the combustion chamber. One of the functions of the spark plug is to dissipate some of the heat produced during combustion. This is mostly transferred into the cylinder head. The 'Heat Range' indicates the

measure of the spark plug's ability to do this.

A 'hot' spark plug is designed to maintain a sufficiently high temperature at the insulator nose to burn off carbon and oil deposits. A 'cold' spark plug is designed to allow a faster transfer of heat to the cylinder head thus preventing overheating and premature failure.

The heat range selection is obviously a complex task with many factors to take into account. Niterra engineers therefore make specific recommendations for each engine and the use to which it is put.

NGK'S COPPER CORE TECHNOLOGY

WIDE HEAT RANGE

A wide range spark plug is more flexible and performs equally well in a hot or cold engine under stop and go city driving or fast motorway cruising. Engines that tend to run hot need cold type plugs. Those that run cold demand a hotter type. The specific plug for any engine is determined by the plug's heat range. That is the minimum and maximum temperatures between which the plug will offer optimum performance.

The heat range of NGK Spark Plugs is wider than ordinary plugs therefore they are suitable for both high speed and low speed driving. Compared with conventional plugs of the same pre-ignition rating they have more resistance to fouling. Compared to ordinary plugs with equal anti-fouling resistance, NGK Spark Plugs have a higher pre-ignition rating.

NGK'S HEART OF COPPER

Copper wire used in place of the iron core in conventional plugs is the secret of NGK's Wide Heat Range. Copper's superior heat conductivity dissipates heat quicker. It cools the electrode tip and insulator tip which prevents hot spots that could cause pre-ignition. Increased heat resistance does not affect fouling resistance, which is primarily determined by the insulator nose length. The longer the nose, the more susceptible it is to heat and the more free from fouling. By raising the pre-ignition rating with the high conduction copper and leaving the insulator nose long, Niterra produces the Wide Range Plug. One that meets the broad thermal requirements of engines under high and low RPM conditions. With the exception of a couple of older applications, all the spark plugs in this catalogue employ copper core technology.

FIRING END APPEARANCE

THE IRIIDIUM IX SPARK PLUG

The Iridium IX spark plug benefits from the use of the precious metal Iridium on its centre electrode. Iridium is harder than other precious metals used in spark plug manufacture, has an extremely high melting point and offers greater protection from chemical attack. These features allow the use of an extremely small diameter electrode (0.6mm) without compromising the spark plug's service life. When compared to nickel plugs, service life is greatly extended. Combined with the use of the taper cut ground electrode this spark plug has superior gas flow properties and lower voltage requirements, which offers further improvements in starting, idling and throttle response.

Iridium spark plugs are used in many high performance engines and in competition. Owners who want the very best performance will want the best spark plug we can offer with Iridium IX.

BR8EIX

Iridium IX
packaging

The close up section shows the annular gap between the centre electrode and insulator nose which provides cold fouling protection.

Should current try to leak away across a carbonised insulator a spark can occur between the electrode and the insulator thus burning away the carbon deposit.

SPARK PLUG INSTALLATION TIPS

- Refer to current NGK catalogue for correct spark plug selection
- Check condition and cleanliness of threads in cylinder head
- Ensure plug is gapped according to manufacturers specification (fig 1). Extreme care must be taken if attempting to adjust the gap of a precious metal spark plug
- Multi ground electrode plugs cannot be regapped - visual inspection only
- Install new spark plug by hand until it seats - (fig 2) a length of rubber tubing pushed over the insulator can be a useful aid for plug installation where access is difficult
- Tighten to specified torque setting as shown in the chart below (fig 3)
- If a torque wrench is unavailable then refer to vehicle/engine manufacturers installation instructions or the tightening angle advice which is displayed on current NGK packaging (excluding specialist race plugs). Note that this angle advice can differ between part numbers due to individual spark plug design (e.g. seating type, thread diameter and gasket material)
- It is important not to over or under tighten spark plugs during installation. Overtightening can lead to distortion of the spark plug. Under-tightening can cause overheating due to poor heat dissipation. In extreme cases incorrect tightening can cause spark plug breakage and/or engine damage
- Niterra does not recommend the application of lubricant to spark plug threads as the resultant reduction of frictional forces at the thread faces will render the torque charts inaccurate and over tightening could occur
- If a gasket type spark plug is re-installed, it should only require a further 1/12 of a turn after it has been seated
- Always carefully use the correct tools for removal/installation to prevent damage to the spark plug or engine
- Inspect spark plug cover and renew if necessary

3 FOR FLAT SEAT TYPE (WITH GASKET)						TAPER SEAT TYPE	
Thread Dia.	18 mm	14 mm	12 mm	10 mm	8 mm	18 mm	14 & 12 mm

CONVERSION CHART (SPARK PLUGS)

IMPORTANT:

This chart is furnished as a guide only. Certain design differences may exist between our spark plugs and another manufacturers; heat ratings can also vary. Always refer to the main application data to select the recommended item for specific engines.

NGK GLOW PLUG TYPES AND FEATURES

METAL SHEATHED GLOW PLUGS

Single Coil Types

Standard single coil glow plugs heats at a fairly uniform rate to its maximum temperature with a constant current consumption. Rapid Glow types have a single coil which changes its resistance as the temperature rises. This allows an initial high current draw to promote faster warm up, with a reduction in current draw as the temperature rises.

QGS Types

Quick Glow System glow plugs are available in single & double coil types. They both use a very low resistance heating coil to allow enormous current flow for a very fast heating time. These glow plugs require strict regulation to prevent damage and are only used with a specifically designed QGS controller.

SRM Types

Self-Regulating Metal glow plugs contain two coils. The heating coil at the tip of the probe provides the heat source; the second (regulating) coil allows an extremely fast warm up time to temperatures in excess of 900°C and once this temperature is reached can autonomously maintain a high final temperature allowing longer post heating times.

AQGS Types

Advanced Quick Glow System glow plugs reach 1000°C in 2 seconds and can maintain this high temperature for long-term post glow capability to promote cleaner vehicle emissions.

CERAMIC GLOW PLUGS

SRC Types

Self-Regulating Ceramic glow plugs reach temperatures in excess of 1000°C. With the use of ceramic, these glow plugs are afforded the greatest protection from the prolonged high temperatures involved with extended post glow heating periods.

QGS Types

Similar to the metal sheathed QGS types, but offers faster heat up times to greater temperatures, although still requires strict regulation with a specialist QGS controller.

NHTC Types

New High Temperature Ceramic glow plugs use the latest technology to allow extremely fast heat up times to eliminate the concept of pre-glow. They also have the ability to maintain post glow temperatures as high as 1350°C to further help vehicle manufacturers reduce engine emissions.

Double Coil Type

GLOW PLUG INFORMATION

It is essential that the correct voltage and current are used in line with the vehicle manufacturers recommendations. If the voltage or battery capacity is too low, the glow plug will not get hot enough and the vehicle may fail to start. If the voltage is too high the heating coil may melt or the glow plugs service life will be reduced.

The pre-heating time of glow plugs can vary significantly, dependant upon the technology of the glow plug in use. For example, standard type glow plugs may take 20 seconds to reach 800°C, whereas the latest ceramic types can reach in excess of 1000°C in 2 seconds.

If starting difficulties are experienced, continuous cranking or leaving the ignition switched on without the engine running can lead to premature failure of the glow plugs and draining of the battery. A better method is to switch the power off and retry the starting procedure after a short period of time.

GLOW PLUG REMOVAL SHEAR VALUES

Thread Diameter	NGK GP Shear Torque	Other Manufacturer GP Shear Torque
8 mm	20 Nm	20 Nm
9 mm	30 Nm	22 Nm
10 mm	40 Nm	35Nm
12 mm	50 Nm	45 Nm

GLOW PLUG INSTALLATION TORQUE

Metal Glow Plug					Ceramic Glow Plug	
Thread Diameter					Thread Diameter	
8 mm	9 mm	10 mm	12 mm	18 mm	8 mm	10 mm
8.5 Nm	11 Nm	15 Nm	23 Nm	23 Nm	10 Nm	18 Nm
+/- 10%	+/- 10%	+/- 10%	+/- 10%	+/- 10%	+/- 10%	+/- 10%

Always refer to the information shown on the NGK packaging, or the vehicle manufacturers instructions.

Glow plugs are often installed in engines for many thousands of miles, some vehicles are more prone to others in presenting removal problems. To help avoid glow plug breakage, use a torque wrench that can operate anticlockwise and set to the glow plug shear value. Upon removal difficulty, if time permits, apply penetrating oil around the glow plug, then a squirt of synthetic engine oil - continue to use the vehicle and tackle the job another day - to allow the oil to penetrate. Remove the glow plug whilst the engine is still hot, using obvious precautions to protect hands.

Closely examine the glow plug and heater tube. A slightly 'shiny' appearance indicates the heater tube has been caked by carbon and 'scuff/swirl' marks on the tube are where the plug has been unscrewed through the carbon. Carbon can be the root cause of a problem, acting as a heat soak, causing hard starting and premature heating coil failure. A proprietary glow plug reamer set should be used with silicone free grease to remove the carbon. A swollen heater tube tip can be a sign of over voltage. See 'Interpretation of Glow Plug Appearance' for more problem examples.

Refer to the NGK packaging for installation advice. NGK glow plugs do not require the application of anti-seize grease to the threads. Always install down on to the taper seat by hand before final tightening using a tool. If any resistance is felt, stop and investigate why. Screwing a glow plug into accumulated carbon can cause heater tube damage or breakage. Do not over tighten the glow plug. If the electrical connection is secured via nut - for a 4 mm stud, tighten the nut to 0.8 - 1.5 Nm and 5 mm stud, tighten the nut to 3.0 - 4.0 Nm.

Testing Sheathed Type Glow Plugs

In order to check the heating coil, measure its resistance as shown in the diagram (excluding double insulated, CX type part numbers). Some resistance values are extremely low (such as some QGS types) and should only be tested with an Ohmmeter capable of recording values down to 0.1Ω. Testing glow plugs by connecting directly across a battery is NOT recommended as, apart from risk to personal injury, damage can occur to the internal construction of the glow plug if it is not designed to have continuous voltage applied (e.g. QGS types).

Resistance value ∞ : The heating coil is broken

Resistance value less than 5 Ω : The heating coil is in good condition

GLOW PLUG INFORMATION

The glow plug system is no longer used in many modern vehicles as a pure cold start solution.

For many years now, the glow and pre-heating system in modern passenger vehicles is now used to assist with vehicle manufacturers emission control strategy.

The precise control and duty cycle of glow plugs has become far more heavily used, with some items now including pressure sensing to assist with engine monitoring. These specialist PSG types (**P**ressure **S**ensor **G**low) cannot be interchanged with standard type glow plugs without causing ECU issues, and may even require an ECU learning cycle or programming to ensure correct operation.

Since Euro 6 was introduced, DPF (**D**iesel **P**articulate **F**ilter) equipped vehicles have become the norm, with removal being an MOT failure. With this technology, DPF clogging issues and continued forced '*re-gens*' in attempts to clear fault codes can also have detrimental effects on associated vehicle engine components, including glow plugs and their associated controllers, EGT (**E**xhaust **G**as **T**emperature) sensors and lambda (Oxygen) sensors, in some cases leading to premature failure of previously replaced items due to over-work.

As with all diagnostics, the root underlying cause should be identified prior to replacement of glow plugs, or any related components.

Appearance	Causes	Recommended Counter Measure
Melted Heater Tube	1. Abnormal Overheating a) Incorrect fuel injection timing or volume flow rate. b) Abnormal combustion due to excessive lubricating oil entering the combustion chamber. 2. Excessive Voltage a) Incorrect glow plug has been fitted. b) Faulty controller relay or glow plugs switched on too long.	a) Check fuel injection. b) Check valve guides and piston rings. a) Confirm glow plug part number is correct. b) Check controller relay operation.
Heating Coil Broken ∞ Resistance	a) See excessive voltage above. b) See carbon build up below.	
Broken Heater Tube	Excessive turbulence or overheating due to incorrect fuel injection timing or volume flow rate.	Check fuel injection timing and volume flow rate.
Shiny appearance on heater tube Swirl marks on heater tube Carbon build up at taper seat area	Build up of carbon surrounding glow plug heater tube in combustion chamber	Ream excessive carbon from glow plug hole prior to fitment.

This catalogue is intended for vehicles/engines officially imported or manufactured in the UK and supersedes all previous versions, which should be disposed of. Whilst every care is taken in compiling these lists of applications, they are given for general guidance only, and do not constitute any contractual term, representation, or warranty and as such Niterra UK Ltd. do not accept any responsibility in respect of any claim whatsoever and howsoever caused arising from the publication of this catalogue.

NGK and NTK products **distributed by Niterra UK Ltd** are designed solely for use in automotive, motorcycle, marine, horticultural, agricultural, commercial, industrial, and stationary engines. **They should not be used in aircraft engines.** Niterra goods destined for aviation use are likely to differ in specification and should be purchased through the OES parts supplier for the engine.

Resistor spark plugs should always be used where they are recommended by the manufacturer. The use of non-resistor plugs could, in some cases, result in interference with and/or damage to electronic components.

Specifications subject to change without notice.

NGK and NTK products listed in these application guides do not apply to racing or modified engines, except where explicitly stated.

SPARK PLUG SELECTION FOR CLASSIC ENGINES

A number of factors have to be considered when selecting suitability which can differ from the originally recommended item.

The following points need to be considered before looking at available spark plugs:

- Intended use (Competition / Hard use / General Road / Commuting / Low speed or Vintage road runs / Museum)
- Condition of engine
- Fuelling / Timing set up
- Modifications (including upgrades to ignition system)

All the above points can have a significant effect, and even result in engine damage if the incorrect spark plug is used.

LONG TERM STORAGE

Classic and vintage engines are, by their very nature, less likely to be used as everyday vehicles. If fuel is left un-used for a prolonged period, then the fuel can become 'stale' over time. When the engine is attempted to be started, the stale fuel can wet foul any spark plugs and fail to start. A sensible precaution to prevent this issue is to drain any fuel from the vehicle before storage. Modern fuels can be susceptible to degrading more quickly, becoming harder to ignite after a short period of time, often within only a few months. The introduction of higher ethanol content into forecourt fuels has created additional concerns. There are proprietary fuel stabiliser additives on the market, designed to prevent this from occurring, but Niterra cannot comment on their effectiveness as we have no direct experience in the use of these products.

RESISTOR SPARK PLUGS

Many older ignition systems are based on lower voltage magneto set-ups. NGK resistor plugs use a high quality ceramic material for the resistor construction, which provides a very stable resistance level, typically 5k Ohms. A magneto ignition system can still generate thousands of volts, which is more than capable of operating with resistor plugs. The actual level of resistance at the electrode gap under combustion chamber pressures is far greater than any resistor installed in a spark plug. Resistor plugs can and are used by many owners with this system without any issues, providing the ignition system is in good condition. Some owners successfully use the modern NGK Iridium 'IX' range of spark plugs in conjunction with magneto ignition systems. One advantage of the 'IX' range is the use of a very fine-wire centre electrode (0.6mm diameter), which requires less voltage to create a spark, beneficial when using a low powered ignition system.

HEAT RANGE AND INTENDED USE

The heat range is a measure of the ability of the spark plug to disperse the heat of combustion from the nose of the plug. Put simply, a spark plug does not produce any heat, but must manage the heat it is subjected to from the combustion process to maintain its optimum operating temperature (between 450-870°C). Please note this temperature refers to spark plug firing end (nose) temperature and is not related in any way to cooling system or oil temperature. If the firing end of a spark plug exceeds 870°C then the ceramic can ignite any fuel on contact, leading to pre-ignition and subsequent engine damage. If the firing end of a plug falls below 500°C (the minimum self-cleaning temperature) it can allow carbon to accumulate on the insulator, eventually leading to a misfire as the current leaks away to ground. Therefore, selection of heat range is critical for the engine the spark plug is intended for. NGK spark plugs use a low number (e.g. 2, 4...) for a 'hot' (soft) spark plug - designed to retain relatively low combustion chamber temperatures in the firing end of the plug to prevent fouling. A 'hot' plug is usually found in horticultural equipment. A 'cold' (hard) NGK spark plug will have a high number (e.g. 8, 9, 10...) - designed to disperse the high combustion chamber temperatures quickly to prevent the firing end from overheating. 'Colder' type plugs are usually found in high performance equipment (sports bikes/race cars).

The actual use the engine is put to can also have an affect on combustion chamber temperature. Many vintage or classic machines are subjected to occasional starting whilst in storage or they are left to warm up gradually by the owner before use. Whilst this is mechanically sympathetic for the engine components, it can be detrimental to the spark plug. This is because the idle mixture can be very rich, and/or the combustion chamber temperatures lower than when in normal road use. This can quickly lead to fouling of the plug firing end, again eventually resulting in a misfire.

Another cause of fouling of the plugs can result from how the engine is used. If we take, for example, a classic motorcycle which originally has a 'cold' NGK B8ES spark plug recommended for the machine when it was new. This spark plug may have been perfectly acceptable when the bike was used every day, under 'spirited' use by the proud owner enjoying the full performance of their new machine. If this same machine, 30-40 years later, still in exemplary mechanical condition and set-up, is only used on very low speed club runs, then the original plug heat range may be unsuitable as it cannot reach its operating temperature. In this instance, if the present owner decides they are not going to use the machine any harder, then a 'hotter' B7ES may be a more appropriate spark plug option, providing they understand the risks of pre-ignition when using a 'hotter' heat range. The reverse of this example can also be relevant. If we take, for example, a road production vehicle which is only used by the current owner as a track or competition machine, then the original recommended road plug could overheat if the engine is in constant full-load/high speed use. In this case, if the standard recommended plug is a B8ES, then a colder B9ES may be a more suitable spark plug, to cope with continued high speed use and associated higher combustion chamber temperatures.

One point to note is that 2-Stroke engines are far less forgiving on plug heat range compared to 4-Stroke engines. If the heat range of the plug selected for a 2-Stroke is too 'hot' (soft), then the dangers of pre-ignition can quickly lead to the dreaded melted piston conclusion.

FOULING

Fouling of a spark plug to the point of misfire, occurs when the surface of the ceramic insulator surrounding the centre electrode is coated in contaminants, which allows the spark current to leak away to ground. Any particles adhering to the insulator surface can provide a conductive path for electricity. It should be noted that these particles do not come from the spark plug, and as such fouling is always a result of particles within the combustion chamber, rather than a fault of the plug. There are many causes that can lead to fouling of a spark plug, incorrect fuel mixture, excess oil entering the combustion chamber, stale fuel or incorrect heat range selected, to name a few. In all cases, replacing the plugs can temporarily cure the misfire or starting problem, but if the root cause is not identified then the fouling problem will eventually re-occur.

A tactic sometimes employed to overcome oil fouling of spark plugs in an engine that suffers from excess oil in the combustion chamber is to attempt using a 'hotter' (softer) grade heat range. This is in effect attempting to treat the symptom rather than curing the cause, one of the only examples where a 'hotter' plug may be selected, provided the risks of detonation are understood first.

MODIFICATIONS

Modifications carried out to an engine to increase its horsepower will increase the combustion chamber temperatures. Any published Niterra catalogues are for un-modified production engines only. When an engine is designed by a vehicle manufacturer, hundreds of hours of testing and design are dedicated to ensure that each engine component will operate to satisfaction across a variety of engine and environmental conditions. Any engine modification in effect alters the engine characteristics and as such, it is the end user's responsibility to ensure that every engine component that may be affected is considered and re-specified if necessary. This is especially relevant to spark plug design and heat range. It is not possible for Niterra to provide a recommendation for a modified engine. For Niterra to publish a recommended item, the product needs to have undergone testing, verification and be certified for that engine. Suggestions can be made regarding plug types to test, but the list for modifications and variations is endless and as such making a definitive recommendation is not possible.

COUNTERFEIT NGK PLUGS

Although not a regular occurrence, it has become a more common enquiry with the popularity of online sales and it is inevitable that dubious companies may try to cash in on Niterra established quality reputation. Thankfully, the UK market has had very few confirmed reports of this problem. Copies can be very deceiving in appearance, but they can significantly underperform genuine Niterra products (over-heating, fouling, breakage) and can result in engine damage. The poorest quality imitations can sometimes be identified by their obvious poor quality materials and construction, compared to the expected high quality of genuine Niterra items. Although we do not publish any definitive guide, intentionally to reduce any information that counterfeit companies can use, some signs to notice are; corrosion of the metal shell, misspelt or lettering printed at an angle, significant colour difference between the parts of the metal shell (NGK items are single piece metal shell), or a loose sealing gasket (NGK items have a captive gasket). The copies can be very deceiving in appearance, but their performance can significantly underperform genuine Niterra products (over-heating, fouling, breakage) which can result in engine damage. A recent incorrect assumption is that non-genuine Niterra items have an over-sized 'S' at the end of the part number. Although it is still possible that a counterfeit could be produced with or without an oversized 'S', this does not signify a definitive 'fake'. Another misconception is that a different appearance when comparing packaging means some plugs are not genuine. Although this can be the case, note that Niterra packaging can change or contain different markings to satisfy certain legal criteria for different worldwide markets.

NGK spark plugs used to have a golden colour anti-corrosion plating to the metal shell. As we are a company dedicated to pursuing continued advancements in technology and materials, the plating has also changed. Modern NGK spark plugs now have a more bright silver appearance to the metal shell. Anyone with concerns about purchasing counterfeit plugs should always purchase through a long established Niterra stockist.

SUMMARY

In essence a spark plug is a simple device for creating a spark, although as can be seen above, it is a very complex subject that can involve many different designs, materials and heat ranges. The spark plug can be affected by many external factors, which can alter its performance.

EXCELLENCE

FROM THE WORLD'S NO.1

// GLOW PLUGS

Give diesel engines the optimum temperature boost they need to start.
Delight your customers with precision fitting every time. Extensive parts
coverage and world-class performance by your side. Choose NGK glow plugs.

Quickly find exactly what you need at [ngkpartfinder.co.uk](https://www.ngkpartfinder.co.uk)
